

## Emergency actions for the mitigation of environmental impacts

12.05.2024 Page 1

Client	Facts	
Automotive industry	Period	2017
	Project Country	Brazil
	UF	SP
	Three dual-case wells (20 meters) installed over 7 days	
	Management of more than 100 professionals	
	Generation of over 1500 m³ of reuse water per month	

## Following a fire in a bulk storage warehouse at the Port of Santos, in the state of São Paulo, EBP Brasil (formerly Geoklock) was retained to:

- Conduct campaigns to monitor the quality of the estuary water, including the aquatic biota;
- Define emergency actions to minimize the consequences of the damage to the quality of the estuary water due to the release of firefighting water;
- Propose programs for the recovery of the surface water quality.

The project also identified the following issues for the local soil:

- Affected areas:
- Potential primary sources of soil and groundwater impact;
- Materials generated in the accident;
- Other potential sources of impact.

Having gathered all data, EBP Brasil (formerly Geoklock) proposed an environmental recovery plan, considering all short- and medium-term emergency actions required, such as:

- The containment of active sources of contamination;
- The detailed investigation of environmental impacts;
- The survey of underground plants;
- Other underground structures;
- Studies to monitor the physical medium and the biota on land and in the estuary.
