

Data Science

With the exponential increase in quantity and speed with data and information being obtained, the need to develop new tools and capabilities also grows. Since the conventional analytical approach is unable to extract equally relevant information about these massive data sets, also known as Big Data, we need new ways to extract knowledge from the data, with quality and efficiently for the continuous improvement of the process, what is known today as machine learning.

In this sense, EBP Brazil has developed a data-oriented culture, using consecrated tools such as

- Data visualization
- Statistical inference
- Multivariate statistical analysis
- Three-dimensional modeling of geospatial data
- Machine Learning

We are at your disposal to introduce this new approach to your company and enable the digital revolution in the environmental area.
