

Intervention Plan

EBP Brasil has extensive experience in the rehabilitation process of contaminated areas and remarkable knowledge of techniques and intervention measures. Once the conceptual model of the site is defined, environmental remediation actions are evaluated. The Intervention Plan offered by EBP Brazil, besides meeting the requirements recommended by CETESB, is a reference document for clients and parties interested in contaminated areas management.

From the setting of objectives to environmental conditions, the Intervention Plan prepared by EBP Brazil addresses the following items:

- Objectives of the Intervention
- Justification and deadlines
- Intervention measures and remediation concept
- Intervention Map
- Remediation techniques and selection criteria
- Engineering Projects
- Treatment and destination
- Targets of remediation
- Schedule and period of operation
- Monitoring efficiency and effectiveness
