

Sustainability

Business sustainability has been evolving very quickly and has been discussed to exhaustion. EBP Brazil applies efficient practices to develop studies, solutions and strategies for sustainability. In addition to environmental inventories for greenhouse gas accounting, sustainability also covers other issues linked to production efficiency and processes, such as energy efficiency, distributed generation and the minimization of the use of natural resources.

Equally relevant is the issue of water, or water resources. A growing number of calculation methodologies and methods have been developed as we strive to use water more effectively. In addition to GHG accounting, the theme of groundwater and surface water reuse and mathematical modeling has also been gaining a lot of interest. EBP Brazil has carried out numerous projects in this area.

Another issue that has been getting a lot of attention is the management of solid wastes. EBP Brazil can develop an effective solution for the adequate disposal of your site's waste materials, starting with the definition of a waste management plan and addressing specific issues such as soil removal and ACM inventory.

We have the capabilities to establish baselines and can offer management tools for operations conducted on an off our clients' sites, with the implementation of processes for a more efficient use of natural resources and the minimization of losses, and aligning your operations with international trends.
