

Analysis of Atmospheric Emissions Requirements

Air pollutants emissions are regulated by environmental agencies to ensure environmental quality. Therefore, companies must meet the emission standards or specific requirements on emissions control.

In order to assist companies in this matter, EBP Brasil analyzes the fulfillment of environmental requirements related to air pollutants emissions.

The survey of emission sources, confirmation of the appropriate use of air pollution control equipment for the pollutant of interest, frequency and sampling parameters of the chimneys and sampling points are examples of the topics analyzed in the studies.
