

Energy Transition Projects

The change of primary energy sources and forms is gradually taking place, as oil is no longer the first energy option.

The sizing and calculation basis for autonomous energy generation systems in industries and companies considers information on electricity consumption, energy efficiency, geographical location, among other factors.

EBP offers its customers the solutions for energy transition, including:

- Technical and economic feasibility study
- Technical advice for business strategies on the subject.
- Support in choosing technology partners for equipment supply.
