

Climate Risks

The climate changes faced today can in some cases become a problem related to the operations of companies and cities. In this context, EBP has developed studies and helped its clients to identify in advance such trends in order to avoid or mitigate the negative effects that may arise.

In many cases, studies need to identify and consider the most likely scenarios to help define structured and coherent action plans facing today and tomorrow's challenges. Risk scenarios can also identify opportunities for certain sectors of industry and commerce, or even help planning their future actions.

Among the studies we carried out on the subject, we highlight the following:

- Flood risk (present and future scenario)
- Critical infrastructure risk assessment and human health
- Climate scenarios with impact on consumption and value generation
